

Units of Measurement

When it comes to defining dimensions in our design system, we primarily use **"rem"** units instead of pixels. This choice is motivated by the need for a more flexible and scalable approach to design.

Why "rem"?

"Rem" units (root em) are based on the root font size defined in our style sheet. This means that each element within our system is proportional to the base font size. By using **"rem"**, we ensure greater consistency and ease of updating in design.

Advantages of **"rem"** Units:

- 1. Scalability:** By simply adjusting the base font size, we can proportionally adjust all element sizes in the design without manually tweaking each individual element.
- 2. Improved Accessibility:** **"Rem"** units allow for greater accessibility as users can customize the text size according to their needs without compromising readability or the design's appearance.
- 3. Consistency Maintenance:** By using a single unit of measurement for dimensions, we maintain greater consistency in the overall design of the platform.

By using **"rem"** units, we reduce reliance on pixels and simplify the design management and update process. Control over the base font size becomes crucial as it impacts all element sizes in our system.
