

Text

When it comes to text, the font size is based on the defined type scale. However, the line height is based on the **8px** system. For example, a heading with the font size of **51px** has a line height of **72px**. A paragraph with a font size of **18px** has a line height of **24px**.

Icons

Icons are sized proportionally with the height being a multiple of 8. The heights being used are **16px**, **24px** and **32px**.

Dividers

Dividers do not adhere to the **8px** system. Instead, there are 2 types: a thick divider with a height of **4px** and a width of **64px** and a slim divider with a height of **1px** and automatic width.

If necessary, the thick divider can also have an automatic width (the width of the parent element).

If keeping up with the vertical rhythm is a must, I recommend you offset the difference by adding an additional top or bottom margin of **4px** for the thick divider and **7px** for the slim one.

Margin and paddings

The width and height properties are not the only ones that use the **8px** system. Margins and paddings also do that, especially the top and bottom values. This is necessary to ensure a proper vertical rhythm that allows elements to fall on the same baseline.

Example: this button uses a padding of 32px left and right and 16px top and bottom. The spacing between the text and the icon is 16px.

On the above example, because of the padding that was used and the fact that the text and icon are also sized according to the **8px** system, the overall button has a height of **56px**, a multiple of 8.
